

NAME

0x0 - interface with **https://0x0.st**

SYNOPSIS

0x0 file [-nv] *filename*

0x0 url [-nv] *URL*

0x0 shorten [-nv] *URL*

DESCRIPTION

The **0x0** utility is an interface to the **https://0x0.st** file hosting and URL shortening service.

The command modifiers are as follows.

file *filename*

Upload the local file *filename*. If *filename* is a directory, a tarball of the directory is uploaded. If *filename* is -, stdin is uploaded.

url *URL*

Upload the remote file at *URL*. Supported protocols are http and https.

shorten *URL*

Shorten *URL*, i.e return a short URL that redirects to *URL* when opened. Supported protocols are http and https.

The options are as follows:

-n Do not execute the curl(1) or tar(1) commands.

-v Output the curl(1) and tar(1) commands that were executed, or would be if **-n** was not passed.

EXIT STATUS

The 0x0 utility exits 0 on upload/shortening, and 1 if an error occurs.

EXAMPLES

Upload the source code of **0x0**:

```
$ 0x0 file "$(which 0x0)"  
https://0x0.st/iU8B.bin
```

Upload a diff:

\$ diff old new | 0x0 file -
<https://0x0.st/iU8L.txt>

Upload a remote file:

\$ 0x0 url <http://www.openbsd.org/art/puffy/ppuf800X725.gif>
<https://0x0.st/iU8n.gif>

Shorten a URL:

\$ 0x0 shorten <https://why-openbsd.rocks>
<https://0x0.st/PmsW>
